

Please amend the claims as follows:

1. (currently amended) A low power a reconfigurable processor core, comprising:  
~~one or more~~ a plurality of ~~processing~~ units, each unit having a clock input that controls the performance of ~~the~~ each unit;  
  
one or more clock controllers having clock outputs each coupled to the clock inputs of ~~the~~ each ~~processing~~ units, ~~the~~ each controller ~~operating~~ varying the clock frequency of each ~~processing~~ unit to optimize speed and processing power for a task; and  
  
a high-density memory array core coupled to the ~~processing~~ units.
2. (original) The processor core of claim 1, wherein the reconfigurable processor core includes one or more digital signal processors (DSPs).
3. (original) The processor core of claim 1, wherein the reconfigurable processor core includes one or more reduced instruction set computer (RISC) processors.
4. (original) The processor core of claim 1, wherein the ~~processing~~ unit includes:  
  
a central processing unit (CPU) having a clock input coupled to ~~the~~ a controller;  
  
and  
  
a buffer adapted to be read by the CPU, the buffer having a clock input coupled to the controller.
5. (original) The processor core of claim 1, wherein the CPU and the buffer are commonly clocked.
6. (original) The processor core of claim 1, wherein the CPU and the buffer are separately clocked.

7. (currently amended) The processor core of claim 4, further comprising a second buffer adapted to receive data from the CPU, the second buffer having a clock input coupled to the controller.
8. (original) The processor core of claim 7, wherein the CPU, first and second buffers are commonly clocked.
9. (original) The processor core of claim 7, wherein the CPU, first and second buffers are separately clocked.
10. (currently amended) The processor core of claim 4, ~~wherein each CPU further~~ comprises comprising:  
a private instruction random access memory coupled to the CPU; and  
a private data random access memory coupled to the CPU.
11. (Withdrawn) A method for clocking one or more processing elements, each element including a central processing unit (CPU) having a processor clock input, a first buffer adapted to be read by the CPU and a second buffer adapted to receive data from the CPU, each buffer having a clock input, the method comprising:  
varying the clock input to the processor and the first buffer based on the fill status of the first buffer; and  
varying the clock input to the processor and the second buffer based on the fill status of the second buffer.
12. (Withdrawn) The method of claim 11, wherein the varying the clock input to the processor and the second buffer based on the fill status of the second buffer further comprises slowing down or stopping the clock if the second buffer is above its high water mark or if the second buffer is full.

13. (Withdrawn) The method of claim 11, wherein the varying the clock input to the processor and the first buffer based on the fill status of the first buffer further comprises slowing down or stopping the clock if the first buffer is below its low water mark or if the first buffer is empty.
14. (Withdrawn) The method of claim 11, wherein the varying the clock input to the processor and the second buffer based on the fill status of the second buffer further comprises increasing the clock if the second buffer is below its low water mark or if the second buffer is empty.
15. (Withdrawn) The method of claim 11, wherein the varying the clock input to the processor and the first buffer based on the fill status of the first buffer further comprises increasing the clock if the first buffer is above its low water mark or above its empty level.
16. (Withdrawn) The method of claim 11, wherein the processor, the first buffer and the second buffer uses a common clock.
17. (Withdrawn) The method of claim 11, further comprising:
  - slowing down or stopping the clock if the second buffer is above its high water mark or if the second buffer is full;
  - slowing down or stopping the clock if the first buffer is below its low water mark or if the first buffer is empty;
  - increasing the clock if the second buffer is below its low water mark or if the second buffer is empty; or
  - increasing the clock if the first buffer is above its low water mark or above its empty level.

18. (Withdrawn) A low power a reconfigurable processor core, comprising:  
one or more processing units, each unit having a clock input that controls the  
performance of the unit, each unit coupled to a source buffer and a destination buffer; and  
means for varying the clock input to the processing unit, the first buffer and the second  
buffer based on the fill status of the buffers and high and low water marks.
19. (Withdrawn) The processor core of claim 18, wherein the water mark is fixed or  
programmable.
20. (Withdrawn) The processor core of claim 18, wherein the processing unit and the  
buffers are commonly clocked.
